FINALITY

A clear decision before money moves

Evidence-based supplier payment review

Sanskriti Aripineni
IBM SkillsBuild AI Experiential Learning Lab

Payment risk and cash pressure

76%

of respondents' organizations experienced attempted or actual payment fraud in 2025

50%

of surveyed small employer firms reported uneven cash flow

Distinct survey populations. These figures establish relevant problems, not product effectiveness.

AFP 2026 survey, 465 professionals. Federal Reserve Banks 2026 report, printed page 3.

Supplier impersonation has real consequences

$120M+

Two U.S. internet companies transferred funds to accounts controlled by a supplier impersonator.

Design response: verify recipient changes against trusted records and require independent confirmation before proceeding.

DOJ sentencing release, December 2019. Scheme operated around 2013–2015.

The user and the payment decision

Business owner, bookkeeper, or finance manager

Before paying a supplier, they need to know:

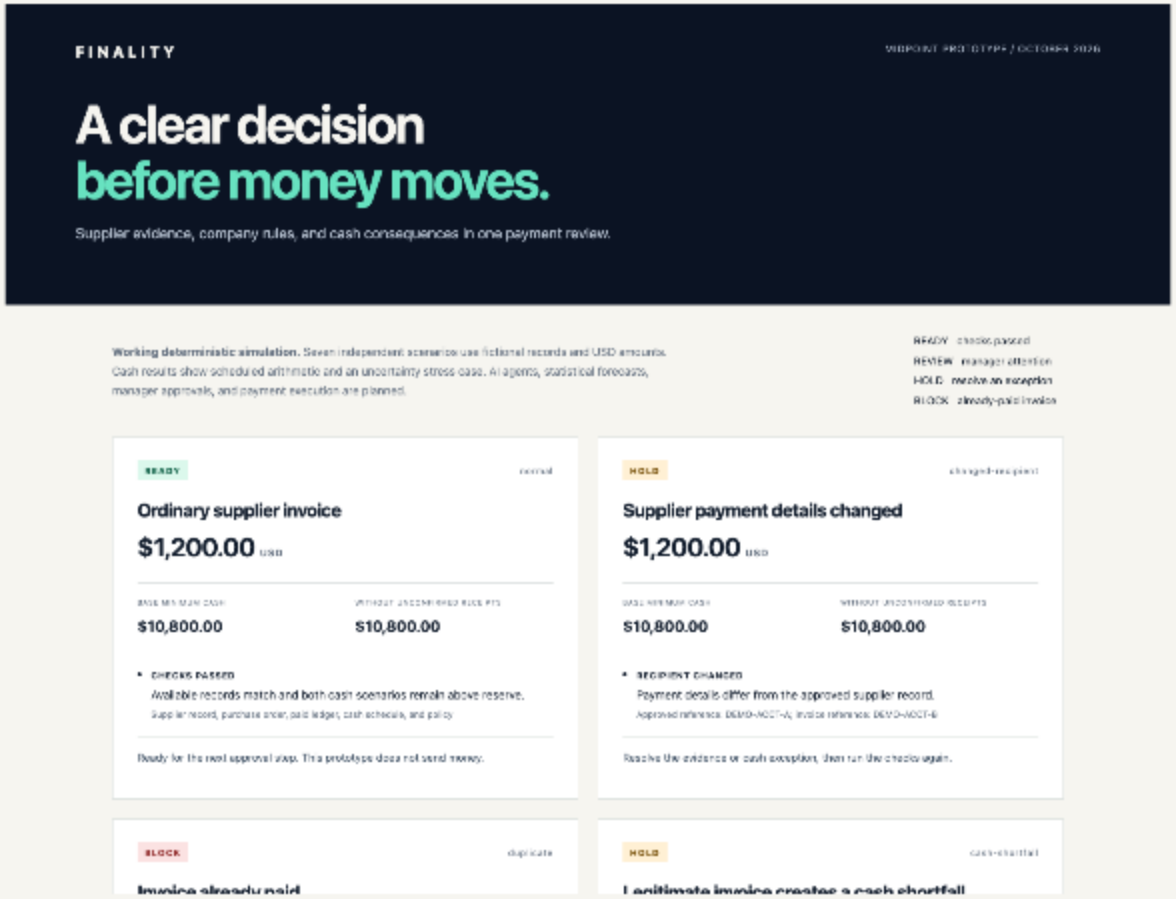

01 Does the invoice match supporting records?
02 Do recipient details match the approved supplier?
03 What happens to cash after upcoming obligations?
04 Who needs to approve this payment?

The FINALITY review framework

Intake	Evidence	Assessment	Decision	Record
Invoice fields and source records	Supplier master Order and ledger	Discrepancies Cash scenarios	Rules and limits Required review	Evidence and next action

Current: structured inputs and deterministic checks
Next: AI document understanding and evidence retrieval

A working payment-review baseline

7 scenarios

14 passing checks

No credentials
No real transactions
Runs offline

The same invoice amount can hide a different risk

Case	Decision	Reason
Ordinary $1,200 invoice	READY	Records match and cash stays above reserve
Changed recipient, $1,200	HOLD	Account differs from approved supplier record
Already-paid $1,200 invoice	BLOCK	Supplier and invoice number match paid ledger

READY means the demonstrated checks passed. No money moves in this prototype.

A legitimate invoice can still create a shortfall

$20,000

Starting cash

$4,000

Minimum after payment and obligations

$8,000 supplier invoice + $8,000 payroll and rent
Configured reserve: $5,000
Decision: HOLD and review payment timing

Existing tools shape the opportunity

Existing solution	Documented focus
Ramp and BILL	Invoice automation, fraud checks, approval controls
Float	Cash forecasts and scenario planning
FINALITY hypothesis	A configurable review that assembles evidence and cash consequences

User need and differentiation still require validation.

The proposed agent layer

Invoice Agent

Extract fields and retrieve supporting records

Risk Agent

Compare recipients and investigate discrepancies

Treasury Agent

Use cash tools to assess timing and uncertainty

Policy Agent

Assemble findings and route required approval

Planned IBM integration. Explicit rules retain payment authority.

Build milestones and evidence of improvement

Milestone	Acceptance evidence
Document intake	Field accuracy and source references on labeled invoices
IBM agent integration	Correct tool use and grounded explanations
Approval and sandbox execution	Changed-payment invalidation and safe retry behavior
Evaluation	Review time, discrepancy recall, false holds, user agreement

Synthetic acceptance cases establish behavior. Representative data is needed for impact claims.

Midpoint progress and next commitment

Completed

Sourced problem and competitor review
Working deterministic prototype
Submission narrative and architecture
Repeatable demo and 14 checks

Next

Confirm IBM account access
Add invoice document understanding
Connect specialist tools and agents
Evaluate against the rules baseline

Personal educational project. Fictional records. No live business deployment.
